

SAT-MASTER I.F. to I.F. processor BIS-802

SAT-MASTER is a solution ...

- Modular: New programs or transponders can be added to the Head-End as required.
- Transparent: The system is completely transparent to the transmission system (analogue or digital), and to the encryption system.
- Low cost: Allows distribution through a single cable up to 30 digital transponders that is approximately 240 television channels.
- That can be used to complement Multiswitch installations: When it is necessary to distribute transponders from a satellite, polarity or frequency band not foreseen, one of the cables of the installation may be connected to the SAT-MASTER Head-End.
- Versatile: When most of the channels to be distributed come from the same satellite, polarity and frequency band, active filters (BIS-806, BIS-807) can be used to filter out the unwanted channels, and BIS-802 to re-allocate channels from other satellite(s), polarity(ies), frequency band(s) in their place.

SAT-MASTER Head-End combined with a multi-switch installation
